NATIONAL GRID REFERENCE: The grid lines form part of the National Grid and are at 100 metre intervals. To give a unique reference defining the position of a point to within 10 metres proceed as follows: 1. Take the two letters preceding the sheet number. 2. Take the west edge of the grid square in which the point lies and read the figure opposite this line on the north or south margin. Estimate tenths of metres from the grid line to the point distance. 3. Take the south edge of the grid square in which the point lies and read the figure opposite this line on the east or west margin. Estimate tenths of metres from the grid line to the point distance. 4. The full four figure number is the National Grid Reference. The full four figure number is given by writing first the letters followed by the Easting and then by the Northing. For further information see 'An Introduction to the Projection for Ordnance Survey Maps and the National Reference System'.

EXAMPLE: 4267 area in hectares, 1.67 area in acres. To convert hectares to acres multiply by 2.47105. To convert acres to hectares multiply by 0.40469.
