NATIONAL GRID REFERENCE

The grid lines form part of the National Grid and are at 100 metre intervals. To give a unique reference defining the position of a point to within 10 metres proceed as follows:

- Take the two letters preceding the sheet number.
- Take the west edge of the grid square in which the point lies and read the figure opposite this line on the north or south margin. Estimate tenths of metres from the grid line to the point (distance 41 = 0888).
- Take the south edge of the grid square in which the point lies and read the figure opposite this line on the east or west margin (distance 28 = 0916).
- The resulting four figure number is the Northing.
- The full ten metre reference is given by writing first the letters, followed by the Easting and then by the Northing.

For further information see: An Introduction to the Projection for Ordnance Survey Maps and the National Reference System.
